

Preconditioning Kit Manual

Electroniq Buttons Boutique*
(Dated: May 20, 2026)

This manual covers basic use and frequently asked questions for the manual preconditioning kit.

I. BASIC SETUP

Start with the installation guides. See WiCAN docs for basic WiCAN setup. This is not necessary to activate preconditioning, but it's highly recommended that you at least change the default WiFi password for security.

II. USER INTERFACE

To activate preconditioning manually, just press the star button on your steering wheel. You should immediately see a countdown in meters/yards on your cluster that hijacks the distance-to-destination indicator. Preconditioning starts when this countdown reaches zero. If the countdown resets, that means something unexpected happened and it's retrying.

When preconditioning activates, you'll see the standard popup saying, "Battery preconditioning activated for optimal DC charging." You'll also get a snowflake or red coil icon over the battery symbol.

If preconditioning never activates, confirm that built-in conditions for activation are met:

1. Battery temperature must be less than 21 C/70 F
2. State of charge must be higher than 20 %

Unfortunately, these are limits that are built into battery management unit firmware that we cannot change with this kit.

III. FREQUENTLY ASKED QUESTIONS

Q: How do I install it?

A: See the installation guides. If this looks too complicated, ask your nearest teenager or car audio shop for help!

Q: Why does my backup camera, car app, or other center screen feature not work after installation?

A: Check the harness modes guide. If you have a WiCAN original or no device plugged into the OBD port, the harness must be in parallel mode. If you have a customized WiCAN, the harness should be in MITM mode.

Q: Does this make my car easier to steal?

A: Not likely, but the installation is designed to be difficult to see for multiple reasons, including security. We highly recommend changing your WiCAN password.

Q: Which cars does this work on?

A: The kit is designed to work on 2021-2024 Ioniq 5s, 2022-2025 Ioniq 6s, and 2022-2024 EV6s. We have tested on Ioniq 5s from three different markets, as well as one Ioniq 6 and one EV6. Contact us if you're interested in using the kit on a different car.

Q: Will this void my warranty?

* support@electroniqbuttons.com

A: Check your country's warranty and consumer protection law. In the US, the Magnusson-Moss Warranty Act offers strong consumer protections. Automaker threats about aftermarket parts "voiding warranties" in many cases do not hold up in court. (This is not legal advice.) At the same time, diagnosis of problems by an automotive technician is challenging, and we highly recommend removal of aftermarket parts and accessories that could make diagnosis more complicated. For example, if you are encountering head unit or USB port problems, it is a good idea to de-install this kit before taking your car into a dealership to avoid complications with diagnosis.

Q: What if I want to build this myself?

A: Do it! Everything we've done is open-source. Feel free to use the wiring harness diagram to build something yourself. The connectors are available on AliExpress. However, if you make a contribution to public knowledge in the form of a pull request to the DBC file or something else, rebates are available that will bring the net cost down to competitive-with-DIY pricing with a lot less labor.

Q: Why can't this be a software update?

A: It could be. We have our guesses as to why Hyundai/Kia hasn't included this in a navigation update. If you know how to hack your head unit and have found the CAN interface functions, you are welcome to add a manual preconditioning button to your head unit. However, distribution of hacked firmware is not possible at this time, so an aftermarket "update" would be difficult to make widely available.

Q: Will this kill my ICCU?

A: No.

Q: Will this kill my 12V battery?

A: Like an OBD reader plugged into the normal OBD port, the WiCAN adds some power usage when the car is off. However, the WiCAN comes with a power saving mode for this purpose. If you're very concerned about this, we encourage you to set the sleep voltage cutoff higher to be safer.

Q: Can I use the built-in navigation while using this kit?

A: With the beta version, this is not possible. This will be fixed with the customized WiCAN.

Q: Will a navigation update affect my ability to use the kit?

A: It's highly unlikely, as the kit doesn't depend on communication with the head unit. A battery management unit update could (for instance, the update that enabled preconditioning retroactively on early Ioniq 5s), but we believe those must be done by dealerships. However, we can't promise with 100% certainty that a navigation update will not affect the functionality of the kit. In the off chance that this does happen, let us know and we will do our best to update logic to restore manual preconditioning functionality.

Q: Will you build me a new button?

A: Maybe! Email us at requests@electronicbuttons.com with your requests.
